

## Kloogo

Matchmaking application for startups and talented individuals

Client

Justas Beržinskas, Ainis Visokinskas Industry Startup Location Spain

## **GOAL OF THE PROJECT**

Our clients came to us with an idea to build a mobile app which will help early stage startups find their dream team members, and vice versa. The main goal was to make the UI very simple, and similar to Tinder, with swiping and matching features. The biggest challenge was having only one week to build an MVP.

## **CORE TECHNOLOGIES**

Xamarin Forms, REST API, Reactive Extensions, CometChat

## **SOLUTION & RESULTS**

In only one week we developed a working cross-platform mobile application which had basic features like creating an account, swiping through profiles, messaging, and matching percentage calculations. With this initial version our clients were able to gather some valuable feedback from their first users and potential investors. In the next couple of weeks we corrected the issues and developed additional features, so that an app became a fullfledged MVP.
